New Secop Cooling Innovations for 2015

Secop will offer a range of new and highly competitive solutions in 2015 for light commercial, DC-powered cooling, and residential applications. The aim of Secop in light commercial is to continue combining compactness and low energy consumption with increased efficiency, capacity, and environmental safety.

As part of this, Secop will continue to convert its R290 and R600a product portfolio to 115 V/60 Hz. The commercial propane (R290) platforms DLE and NLE will also have new types with larger capacities and higher efficiency.

In 2015, Secop will introduce new variants of its successful variable-speed XV platform. Intelligently combining compact size with high efficiency, the XV is targeting global demand for innovation and flexibility in the competitive household

market. Secop's wide range of fixed-speed platforms has been upgraded and optimized simultaneously with the new XV variants. They meet all new efficiency requirements around the world.

An important issue for Secop in the residential segment has been creating targeted solutions for emerging markets. There is no doubt over the potential or the need for intelligent products that can cope with tropical environments and unstable power grids.
